A. DISCLAIMER
ASCI and all related entities, including the International Society of Automation (collectively, “ASCI”) provide all materials, work products and, information (‘SPECIFICATION’) AS IS, WITHOUT WARRANTY AND WITH ALL FAULTS, and hereby disclaim all warranties and conditions, whether express, implied or statutory, including, but not limited to, any (if any) implied warranties, duties or conditions of merchantability, of fitness for a particular purpose, of reliability or availability, of accuracy or completeness of responses, of results, of workmanlike effort, of lack of viruses, and of lack of negligence, all with regard to the SPECIFICATION, and the provision of or failure to provide support or other services, information, software, and related content through the SPECIFICATION or otherwise arising out of the use of the SPECIFICATION. ALSO, THERE IS NO WARRANTY OR CONDITION OF TITLE, QUIET ENJOYMENT, QUIET POSSESSION, CORRESPONDENCE TO DESCRIPTION, OR NON-INFRINGEMENT WITH REGARD TO THE SPECIFICATION.

WITHOUT LIMITING THE FOREGOING, ASCI DISCLAIMS ALL LIABILITY FOR HARM TO PERSONS OR PROPERTY, AND USERS OF THIS SPECIFICATION ASSUME ALL RISKS OF SUCH HARM.

IN ISSUING AND MAKING THE SPECIFICATION AVAILABLE, ASCI IS NOT UNDERTAKING TO RENDER PROFESSIONAL OR OTHER SERVICES FOR OR ON BEHALF OF ANY PERSON OR ENTITY, NOR IS ASCI UNDERTAKING TO PERFORM ANY DUTY OWED BY ANY PERSON OR ENTITY TO SOMEONE ELSE. ANYONE USING THIS SPECIFICATION SHOULD RELY ON HIS OR HER OWN INDEPENDENT JUDGMENT OR, AS APPROPRIATE, SEEK THE ADVICE OF A COMPETENT PROFESSIONAL IN DETERMINING THE EXERCISE OF REASONABLE CARE IN ANY GIVEN CIRCUMSTANCES.

B. EXCLUSION OF INCIDENTAL, CONSEQUENTIAL AND CERTAIN OTHER DAMAGES
TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT SHALL ASCI OR ITS SUPPLIERS BE LIABLE FOR ANY SPECIAL, INCIDENTAL, PUNITIVE, INDIRECT, OR CONSEQUENTIAL DAMAGES WHATSOEVER (INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFITS OR CONFIDENTIAL OR OTHER INFORMATION, FOR BUSINESS INTERRUPTION, FOR PERSONAL INJURY, FOR LOSS OF PRIVACY, FOR FAILURE TO MEET ANY DUTY INCLUDING OF GOOD FAITH OR OF REASONABLE CARE, FOR NEGLIGENCE, AND FOR ANY OTHER PECUNIARY OR OTHER LOSS WHATSOEVER) ARISING OUT OF OR IN ANY WAY RELATED TO THE USE OF OR INABILITY TO USE THE SPECIFICATION, THE PROVISION OF OR FAILURE TO PROVIDE SUPPORT OR OTHER SERVICES, INFORMATION, SOFTWARE, AND RELATED CONTENT THROUGH THE SPECIFICATION OR OTHERWISE ARISING OUT OF THE USE OF THE SPECIFICATION, OR OTHERWISE UNDER OR IN CONNECTION WITH ANY PROVISION OF THIS SPECIFICATION, EVEN IN THE EVENT OF THE FAULT, TORT (INCLUDING NEGLIGENCE), MISREPRESENTATION, STRICT LIABILITY, BREACH OF CONTRACT OF ASCI OR ANY SUPPLIER, AND EVEN IF ASCI OR ANY SUPPLIER HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

FOREWORD
This is one of a series of documents that defines ISASecure certification for systems, which is developed and managed by the industry consortium ISA Security Compliance Institute (ISCI). The current list of documents related to ISASecure SSA (System Security Assurance) can be found on the ISCI web site http://www.ISASecure.org.
1 Scope

This document describes a configuration for testing for the presence of known vulnerabilities in control systems using the Nessus tool (http://www.tenable.com/products/nessus). This type of testing is a part of the SRT (System Robustness Test) component of the evaluation of such a system toward ISASecure SSA (System Security Assurance) certification, as described in the SSA certification scheme document [SSA-100] and the SSA SRT specification [SSA-310]. The vulnerability test aspect of SRT is known as VIT (Vulnerability Identification Testing). This document describes how to configure Nessus to carry out VIT.

In particular, the present document specifies and provides rationale for the configuration of a VIT policy file to be used with the Nessus tool to carry out VIT. The present document describes all parameters configured in the Nessus policy used for VIT. The majority of the parameters are the same for all control systems. However, there is a set of parameters that include authentication parameters for the system being tested. These parameters must be configured for the specific system prior to the execution of the VIT per guidance provided in this document.

This document specifies the Nessus tool version and date for the Nessus vulnerability feed to be used for testing. The set of target devices to be scanned under VIT, and pass/fail criteria for the test, are specified in [SSA-310].

### 4 Overview

This section summarizes the intent and usage for the VIT policy for ISASecure SSA. This policy defines the types of vulnerabilities included in the Nessus scan that is performed for VIT.

The goal of VIT is to find vulnerabilities of all CWE (Common Weakness Enumeration) categories that are reported in the National Vulnerability Database, in any component of a control system under test. These categories are listed at http://nvd.nist.gov/cwe.cfm. VIT has been designed to run in a lab environment, and does not incorporate safeguards that would be required if running against a live system.

Most parameters of the VIT policy configuration are the same for all systems. The only policy settings that need to be configured specific to the system under test are:

- Credentials settings. Tailoring of this configuration element is always required. Guidance in configuring the credentials settings is provided in 6.2.
- Preferences. Settings for a few preferences may need to be modified due to the presence of technologies not in common use for control systems, as described in 6.4.

Any organization may create a Nessus policy in accordance with this document and use it in a licensed copy of the Tenable Networks Nessus tool.

### 5 VIT policy requirements

Following are requirements regarding the Nessus policy to be used for performing VIT.

**Requirement ISASecure_VIT.R1 – Date of vulnerability feed**

VIT SHALL be performed using date filters applied to the Nessus commercial feed of known vulnerability information. The date filters SHALL be set so that all plugins are included in the test, that were modified or published before a date at most one month before the date on the ISASecure SSA certificate based upon the test.

**Requirement ISASecure_VIT.R2 – Nessus server version**

VIT SHALL be performed using either (1) the most recent version of the Nessus server, determined as of the date of the filters applied to the vulnerability feed used for the test or (2) any later version of the Nessus server.
**Requirement ISASecure_VIT.R3 – VIT policy parameters**

The policy used for VIT SHALL be configured in accordance with Section 6 below, "Nessus policy settings."

**Requirement ISASecure_VIT.R4 – Archive and report VIT policy**

The policy file used for VIT SHALL be saved and provided as part of the overall SRT report.

6 **Nessus policy settings**

Each element of the Nessus user interface for policy creation is addressed in the following sections.

6.1 **General settings**

The General settings define the policy and configure the scan related operations. There are several types of options that control the scanner behavior. These types are grouped together within the General Settings as different setting types. Other general settings not listed below (if any) shall be set to the Nessus defaults.

NOTE The Nessus setting types and the allocation of general settings among the setting types may vary by Nessus release.

- Name: Set to name of system under test
- Visibility: Set to shared
- Description: Policy for ISASecure SSA VIT – SSA-420 document Version m.n (version of the SSA-420 document)
- Allow Post-Scan Report Editing: Unchecked
- Safe Checks: Unchecked
- Silent Dependencies: Unchecked
- Log Scan Details to Server: Checked
- Stop Host Scan on Disconnect: Checked
- Avoid Sequential Scans: Unchecked
- Consider Unscanned Ports as Closed: Unchecked
- Designate Hosts by their DNS Name: Unchecked
- Reduce Parallel Connections on Congestion: Checked
- Use Kernel Congestion Detection (Linux Only): Checked
- TCP Scan: Checked
- UDP Scan: Checked
- SYN Scan: Unchecked
- SNMP Scan: Checked
- Netstat SSH Scan: Checked
- Netstat WMI Scan: Checked
• Ping Host: Checked
• Port Scan Range: all
• Max Checks Per Host: 5
• Max Hosts Per Scan: 100
• Network Receive Timeout (seconds): 5
• Max Simultaneous TCP Sessions Per Host: 15
• Max Simultaneous TCP Sessions Per Scan: 19

6.2 Credentials tab

The Credentials tab configures the Nessus scanner to use authentication credentials during scanning. By configuring credentials, it allows Nessus to perform a wider variety of checks that result in more accurate scan results. In order to achieve the results necessary for the VIT, credential scanning SHALL be configured. Since credentials are unique to each system, this document is not able to provide detailed settings and they must be configured on a system by system basis. Credential settings are required whether local, workgroup or domain authentication is used for the control system. In addition to the Nessus settings, there are also required settings on the target computers as well.

There are a maximum of four types of credentials that can be set. The types that are set SHALL correspond to the capabilities of the system under test. For example, for a control system that runs on Microsoft Windows platforms and provides a SSH interface into some of its controllers, the tester SHALL configure Windows Credentials and SSH Settings. The tester may also configure Cleartext protocol settings. When the control system includes Windows based host nodes, those Windows host nodes may require additional configuration to support the Nessus credential scan. In addition, if using Windows hosts and domain authentication, the tester SHALL provide a domain administrator account in the Windows environment to support the VIT. The tester SHALL configure each credential setting at the highest privilege level configured in the control system. These settings are well documented in the Nessus documentation [Nessus UG]. The relevant section is “Creating a New Policy,” in particular the subsection titled “Credentials.”

6.3 Plugins tab

The Plugins tab configures the Nessus plugins to use during the VIT.

Since new plugins are published regularly for Nessus, the VIT policy file used for a system SHALL also include predefined filters. These filters are set to assure that the same plugins can be used for all executions of VIT related to a specific ISASecure SSA certification, so that VIT test results are reproducible. This is done by using date filters.

The settings for the Plugins tab are as follows:

**Plugins:**

All plugins SHALL be enabled for VIT.

**Filter option:**

Set to process all filters.

Two filters are part of the policy:

1) Plugin modification date is earlier than [ISASecure SSA selected date]
2) Plugin publication date is earlier than [ISASecure SSA selected date]

In accordance with ISASecure _VIT.R1, in order to pass certification, the date selected must be within one month (31 days) of the date on the ISASecure SSA certificate. Since the date of this certificate is unknown when the test is being run, the tester may use the current date, but is not required to use it. Using the current date will provide the highest likelihood that the test policy will ultimately comply with ISASecure_VIT.R1. If achievement of certification appears imminent based on all other criteria, and a system passed VIT using date filters more than a month ago, VIT must be rerun using later date filters.

6.4 Preferences tab

The Preferences tab provides a means for granular control over scan policy settings. These settings can be highly customized on a system by system basis for arbitrary systems scanned by Nessus. Many of the preferences are related to policy audits or specific platforms, and since the focus of VIT is vulnerability identification for control systems, these settings will remain unset. Settings SHALL be Nessus defaults except where a value is listed below:

- ADSI settings: Only set if the target works with mobile devices in normal operation.
- Apple Profile Manager API Settings: Only set if the target is an Apple server with iOS devices connected in normal operation.
- Global variable settings:
  - Enable CGI scanning: Checked
  - Thorough tests (slow): Checked
- SMB Registry:
  - Start the registry service during the scan: Checked
  - Enable administrative shares during the scan: Checked
- SMTP settings: Only set if a component of the system under test includes a mail server.
- VMware SOAP API Settings: Only set if a component of the system under test is running on a VMware platform.
- Wake-on-LAN: Only set if Wake-on-LAN is configured on the control system.
- Web Application Tests Settings:
  - Enable Web Application Tests: Checked
  - Try all HTTP methods: Checked
  - Test Embedded web servers: Checked
